

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

## PREFATORY NOTE.

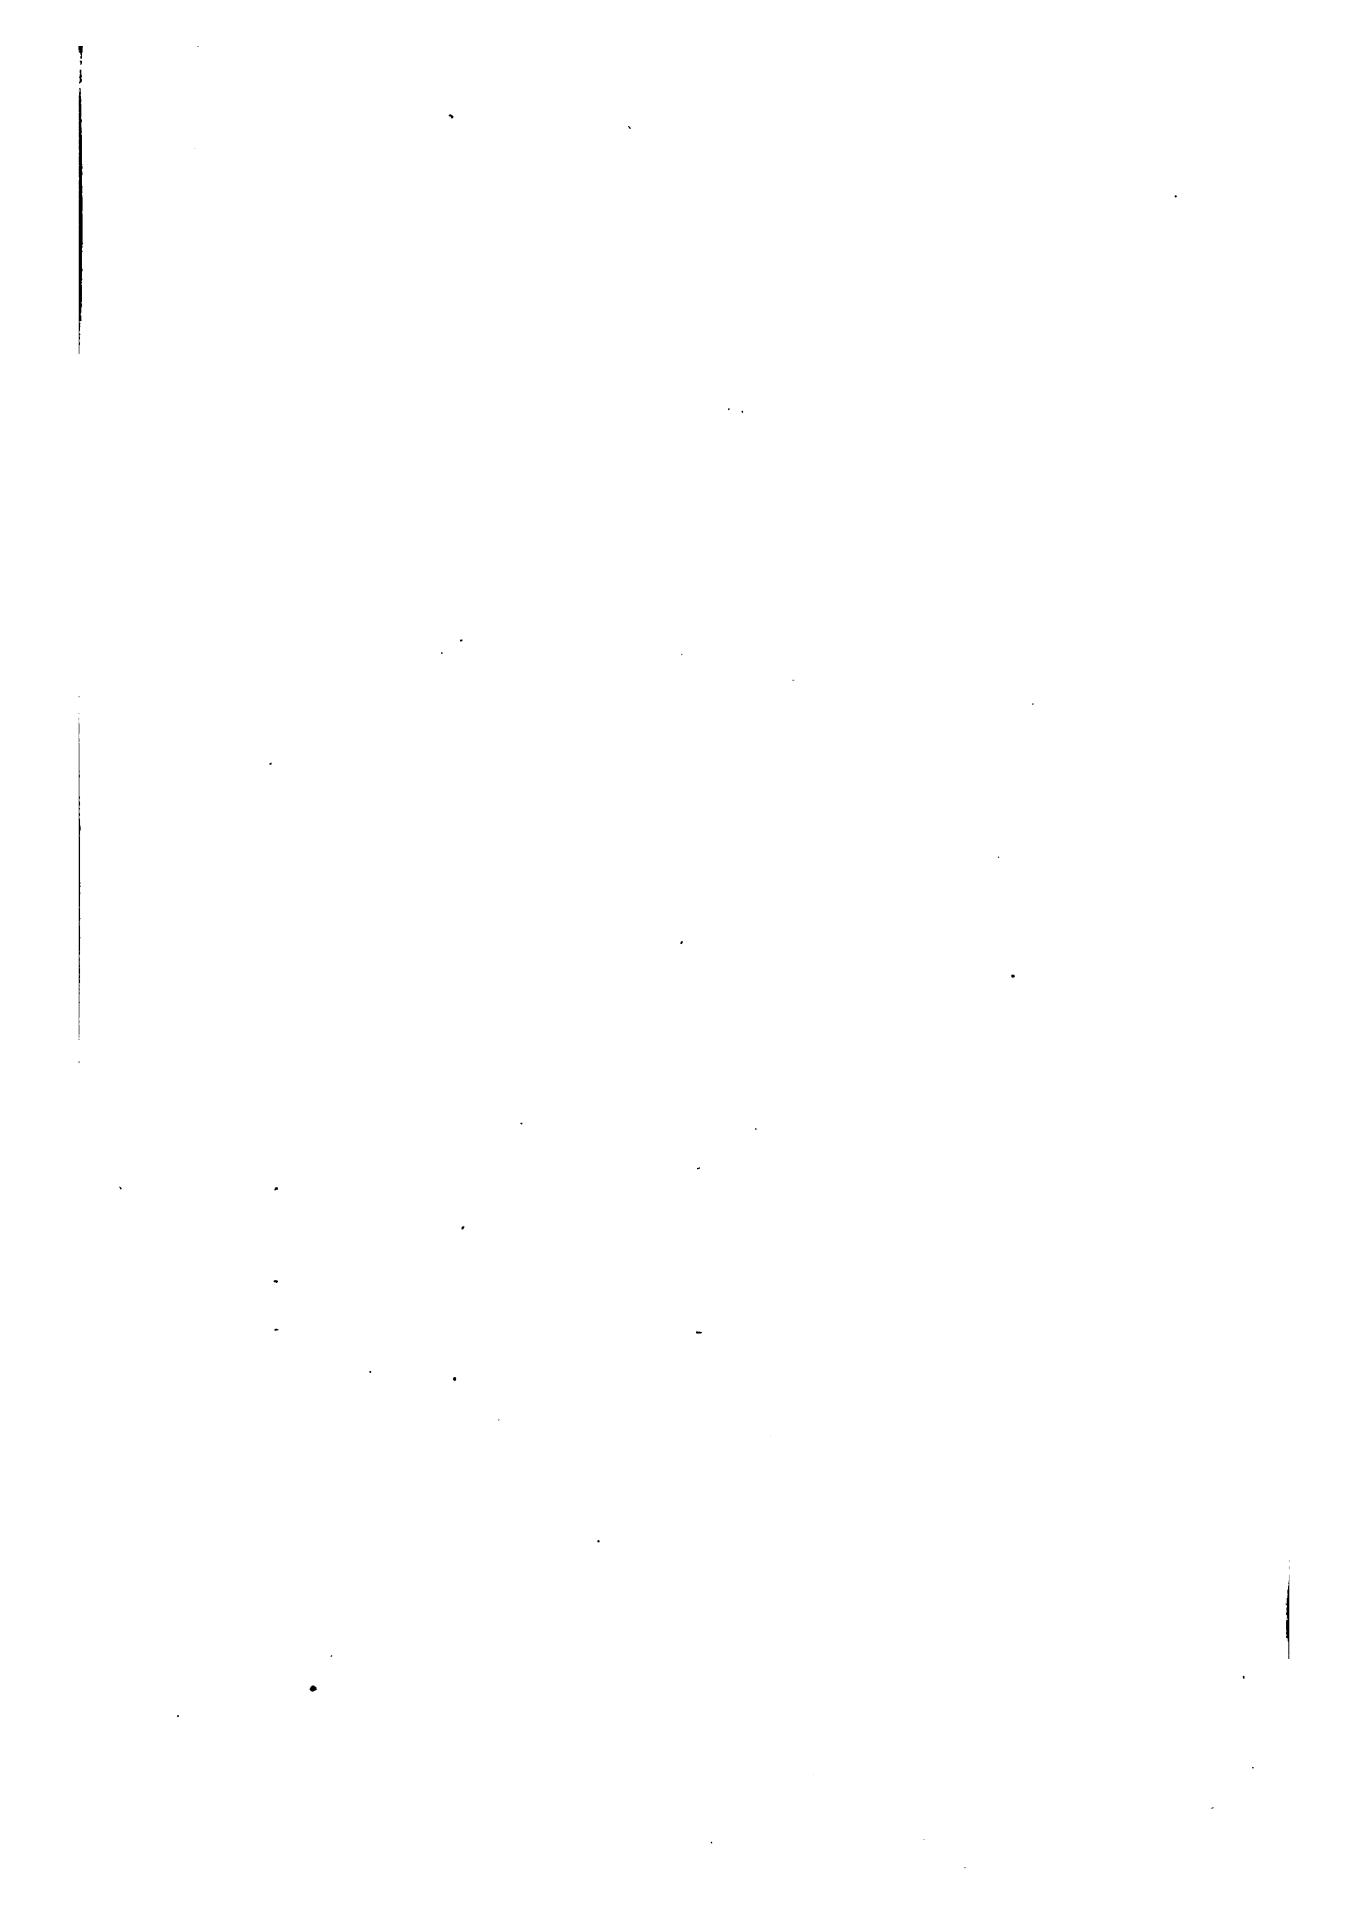

---

THE tables here given have been compiled for the especial use of Meteorological observers in India. Those for the reduction of the barometric readings to the freezing point and to sea-level, are old and well-known tables, which may be found in many other publications of a similar character.\* But the hygrometric tables have all been re-computed and adapted to the mean latitude of 22°.† The computation of the vapour tension tables has been much facilitated by the use of that very valuable and ingenious instrument, the arithmometer, (the invention of M. Thomas de Colmar). The use of this instrument has admitted of the calculation of the differences being carried out to eight places of decimals, when three or four only were required for the tables, and without an appreciable increase of labour; and greater accuracy has thereby been secured.

For the computation of the tables for use with the psychrometer, I have preferred August's formula as corrected by Regnault, having found by experiments with Regnault's hygrometer in the dry atmosphere of the interior of India and at high temperatures, that the results computed by that formula are the most satisfactory.

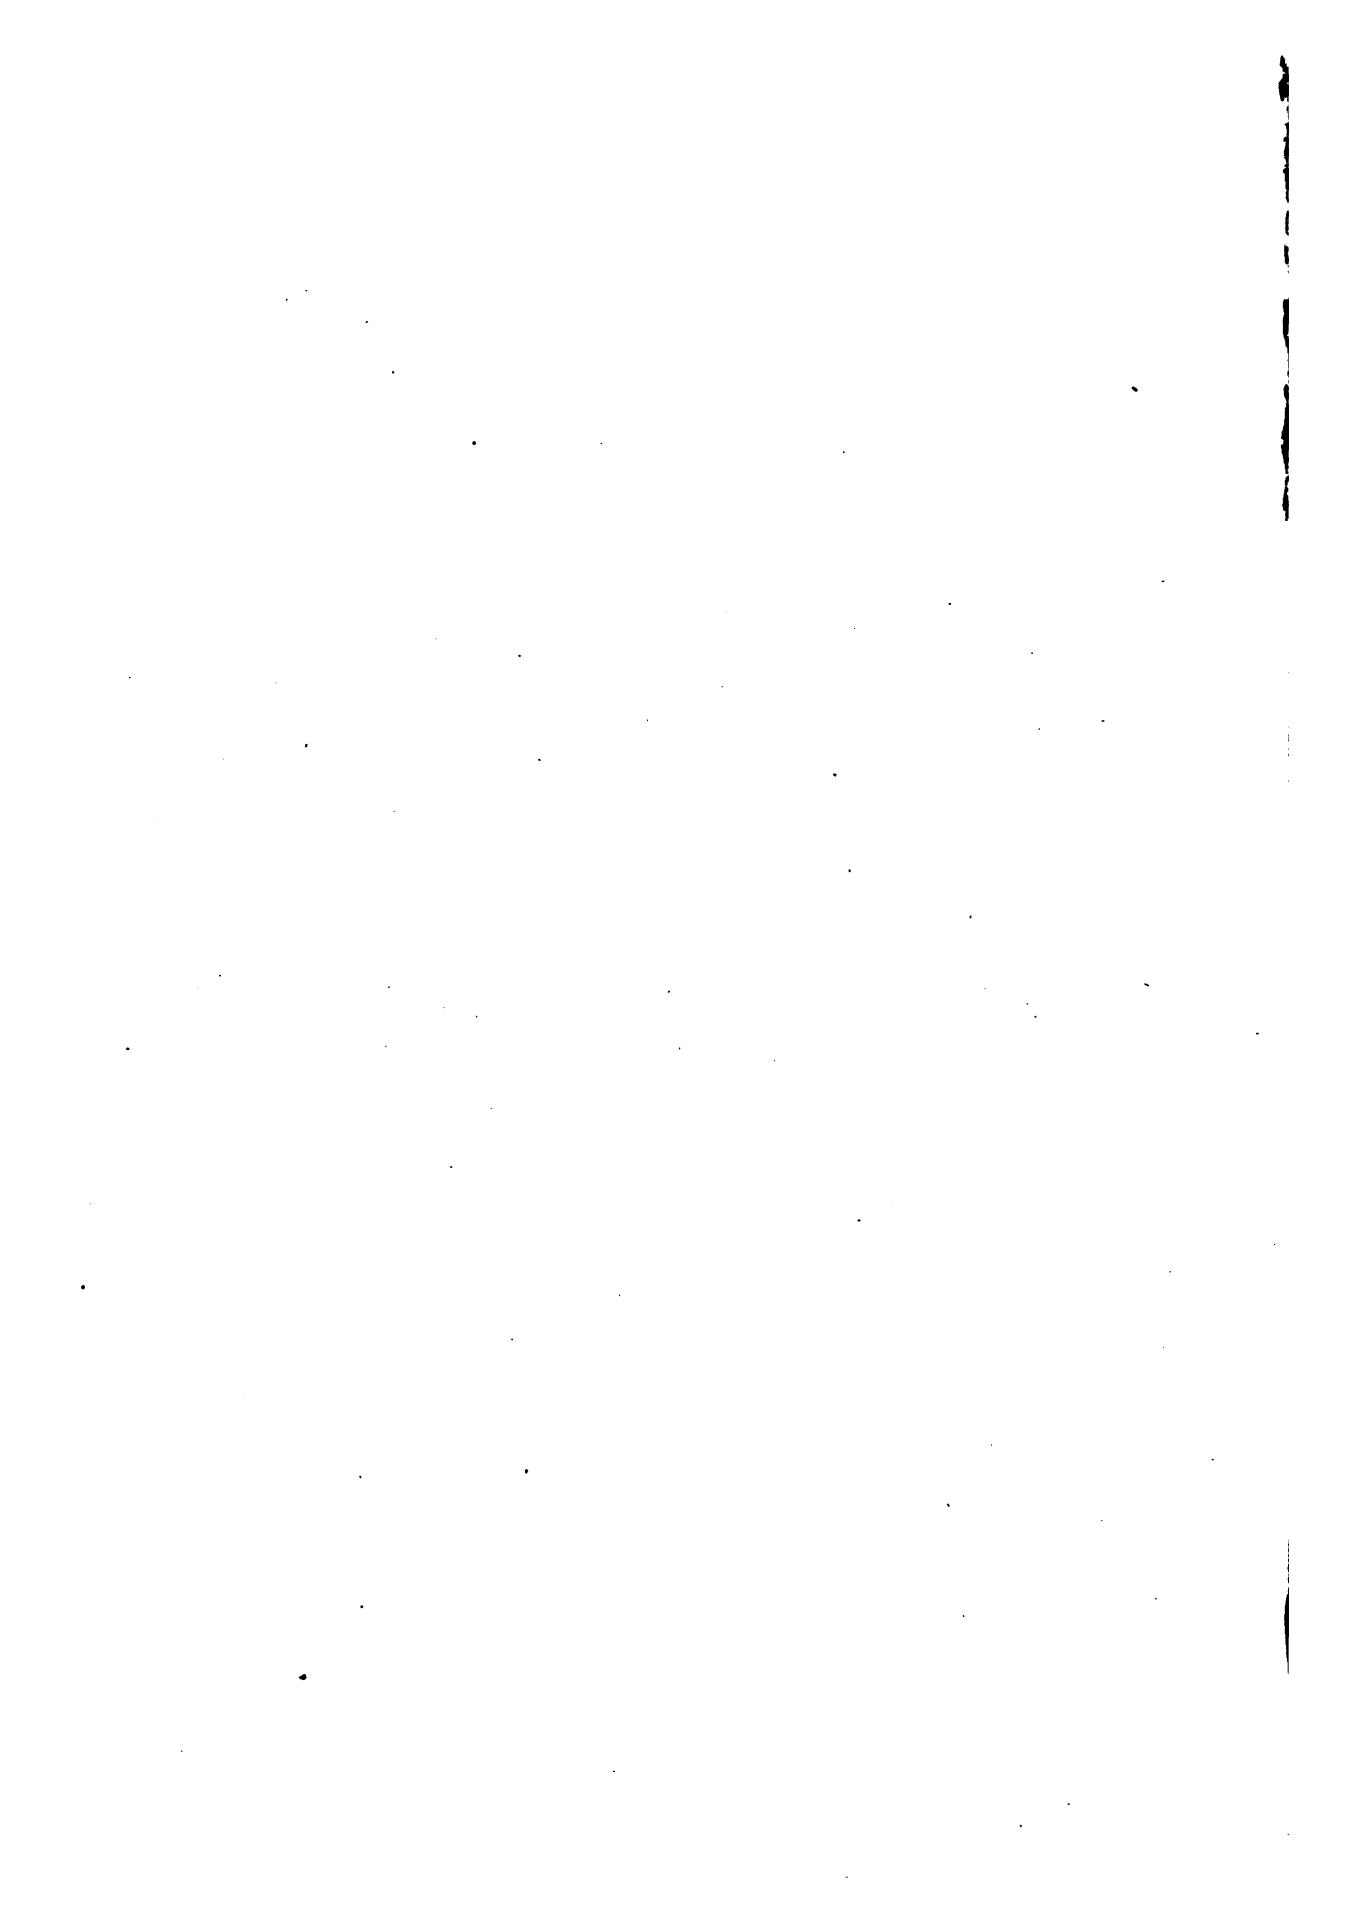

---

\* Table I is reprinted from Colonel James's 'Instructions,' which is more comprehensive than others.  
† The relative humidity tables are the same for all latitudes.

## C O N T E N T S.

	PAGE.
<b>USE OF THE TABLES . . . . .</b>	<b>1</b>
TABLE I.—For reducing the readings of barometers with brass scales to the temperature of the freezing point . . . . .	7

## CORRIGENDA IN TABLES.

---

- Page 8, line 22, for .0064, read .007.  
" 3, " 23, "  $30 \times .108$ , read  $.30 + .108$ .  
" 3, " 24, "  $.0064 \times .108 = .0006912$ , read  $.007 \times .108 = .000756$ .  
" 5, " 15, " .351, read .352.  
" 5, lines 18, 30 and 38, for .335, read .337.  
" 5, line 23, for Table IV, read Table V.  
" 6, " 14, " 7.06, read 7.05.  
" 18, 4th column, line 9, for 0.621, read .0621.  
The vapour tension for  $7.6^{\circ}$ .  
" 18, last column, line 9, for .2246, read .2846.  
This is the vapour tension at  $43.6^{\circ}$ .  
" 19, column 14, for 1.9434, read 1.3434.  
This is the vapour tension at  $88.4^{\circ}$ .  
" 22,  $t' = 52^{\circ} t - t' = 2.5$ , for .256, read .356.  
" 23,  $t' = 40^{\circ} t - t' = 17.5$ , " .019, " .019.  
" 27,  $t' = 67^{\circ} t - t' = 19.5$ , " .412, " .402.  
" 27,  $t' = 72^{\circ} t - t' = 26.5$ , " .427, " .429.  
" 51,  $t' = 70^{\circ} t - t' = 4^{\circ}, 4.5^{\circ}, 5^{\circ}$ , insert omitted numbers 81, 79, 77.  
" 51,  $t' = 76^{\circ} t - t' = 0$ , for 110, read 100.  
" 52,  $t' = 72^{\circ} t - t' = 15.5$ , " 4, " 45.  
" 77,  $t' = 32^{\circ} t - t' = 17.5$ , " 5, " 1.
- 

**N. B.**—The above corrections should be made in ink in the Tables, before they are used.

# TABLES

FOR THE  
REDUCTION OF METEOROLOGICAL OBSERVATIONS IN INDIA.

## USE OF THE TABLES.

TABLE I gives the corrections to be applied to the actual reading of a barometer with a brass scale at any given temperature, in order to find the height of the column exerting the same pressure at the temperature of melting ice. The formula by which such a table is computed is given at page 15.

If the reading of the barometer is within  $+ 0\cdot1$  or  $- 0\cdot1$  of the value at the top of any column, find, in the first column, the temperature corresponding to that of the attached thermometer, and the figures in that line in the column of the observed pressure, is the correction. This is to be deducted if the temperature is above  $28^\circ$ , and to be added if below  $29^\circ$ .

If the barometer reading is not within  $0\cdot1$  of the value which heads one of the columns, but the temperature of the attached thermometer is in integral degrees, the correction is found by interpolation according to the following rule :—

Rule.—*When the barometric reading to be reduced is intermediate between two values represented by columns in the Table, take from the Table the corrections for the pressures next above and below the reading; multiply the difference of these corrections by twice the difference of the barometric reading to be reduced and the lower of the tabular headings. The result, added to the tabular correction for the lower tabular pressure, gives the correction required.*

EXAMPLE.—Let the barometric reading be  $29\cdot720$  and the temperature of the attached thermometer  $85^\circ$ ,

From table with arguments     $29\cdot5$  and  $85$  take  $- 0\cdot149$   
                                    ditto                                     $30\cdot0$  and  $85$  take  $- 0\cdot151$

Difference  $- 0\cdot002$

$$\begin{array}{rcl} 29\cdot720 & - 29\cdot5 & = 0\cdot220 \\ - 0\cdot002 \times .440 & = - .00088 \\ - (.149 + .00088) & = - .14988 \end{array}$$

instead of which we take  $- .150$

$$\begin{array}{r} 29\cdot720 \\ - .150 \\ \hline \end{array}$$

$29\cdot570$  = reduced reading.

If the reading of the attached thermometer is within  $+ 0\cdot2$  or  $- 0\cdot2$  of an integral degree, the tabular correction for the integral degree may be taken. Otherwise, when great accuracy is required, a value is to be found by interpolation according to the rule above given, substituting the words 'thermometric' for 'barometric,' 'temperature' for 'pressure,' 'lines' for 'columns,' &c., and omitting the word 'twice' in the fourth line.

If neither the reading of the barometer nor that of the attached thermometer corresponds to those given in the tables within the limits already assigned, then a double process of interpolation is requisite, thus—

**EXAMPLE.**—Let the barometer reading be 29·720 and that of the attached thermometer 85·6.

Having found, as above, the correction —14988 for temperature 85°, obtain that for 86° by a similar process. This is found to be 15232. The difference is .00244.

$$\begin{array}{rcl} .00244 \times 0.6 & = & .001464 \\ - (14988 + .001464) & = & - 151344 \\ \text{instead of which we take} & - & .151 \\ \begin{array}{r} 29.720 \\ - .151 \\ \hline 29.569 \end{array} & = & \text{reduced reading.} \end{array}$$

In general, interpolation for fractions of a degree is an unnecessary refinement.

**TABLE II.**—This table gives the height of the column of mercury, at 32° Fahrenheit, the weight of which equals that of a column of air of a given height and temperature, when the pressure at the sea-level is 30 inches. It is used for reducing to their equivalent values at sea-level, the barometric readings recorded at stations not more than 500 feet above that level.

To use the table, look down the first column for the value expressing the ascertained elevation of the barometer cistern; and along the headings of the subsequent columns for the temperature corresponding to the observed temperature of the external air (not that of the attached thermometer). At the intersection of that line and column, will be found the figures expressing the decimals of an inch, which are to be added to the barometric reading (previously reduced for temperature) to give its sea-level equivalent.

If this sea-level value is 30 inches, no further operation is required; but if it be less or more than 30 inches, a further correction is to be applied, which is obtained from the right-hand column. Let the value obtained by the first process be 30—d. Multiply by d the figures in the last column, on the line of the given elevation, and deduct the product from the value first found. If d is positive,—that is, if the value first found is higher than 30 inches,—then the correction is to be added.

**EXAMPLE.**—Required to find the sea-level equivalent of 29·403 (reduced reading) at a station 240 feet above the sea, the temperature of the external air being 80°.

With the arguments 240 feet (first column) and 80° (heading of column), take out the tabular value .248:

$$\begin{array}{r} 29.403 \\ - .248 \\ \hline \end{array}$$

$$\begin{array}{r} 29.651 \\ \hline \end{array}$$

$$29.651 = 30 - .349$$

The value in the last column on line 240 feet is .009

$$.009 \times .349 = .003141$$

instead of which we take .003 and deduct

$$\begin{array}{r} 29.651 \\ - .003 \\ \hline 29.648 \end{array}$$

which is the sea-level value required.

If the temperature of the air and the elevation of the barometer are intermediate between the tabular values given, the correction is obtained by interpolation, as in the case of the previous table.

**EXAMPLE.**—Required the sea-level value of 29.916 at a station 184 feet above the sea-level, the temperature of the external air being 73° 4'.

In line 180 and columns 70 and 80, take out the values .189 and .185; the difference is —.004 for the higher temperature:

$$-\frac{.004 \times .84}{10} = -.00136$$

$$.189 - .00136 = .18764$$

which is the correction for 180 feet.

In line 190 and columns 70° and 80°, take out .200 and .196; difference = —.004, as before:

$$.200 - .00136 = .19864$$

which is the correction for 190 feet.

$$.19864 - .18764 = .011$$

$$\frac{.011 \times 4}{10} = .0044;$$

which is the correction of 4 feet: adding this to the value found for 180 feet

$$\begin{array}{r} .18764 \\ .0044 \\ \hline .19204 \end{array}$$

instead of which we take .192

$$\begin{array}{r} 29.916 \\ .192 \\ \hline 30.108 \end{array}$$

The value for 184 feet in the last column (obtained by interpolation between those for 180 and 190 feet) is .0064; and

$$30.108 = 30 \times .108$$

$$.0064 \times .108 = .00068912;$$

instead of which we take .001

$$\begin{array}{r} 30.108 \\ .001 \\ \hline 30.109 \end{array}$$

which is the sea-level value required.

It saves much trouble if a table is computed once for all for each station by the method above given; so that (the elevation being constant) the correction required may be taken out at once for a given pressure and temperature. The following is given as an example of such a table. It is for the observatory at Goalpara, where the barometer cistern is 386 feet above mean sea-level:—

Air temp.	Barometer reading.					Air temp.	Barometer reading.				
	29.0	29.2	29.4	29.6	29.8		29.0	29.2	29.4	29.6	29.8
40	.424	.427	.429	.432	.435	55	.410	.413	.416	.419	.421
41	.423	.426	.428	.431	.434	56	.409	.412	.415	.418	.421
42	.422	.425	.427	.430	.433	57	.408	.411	.414	.417	.420
43	.421	.424	.426	.429	.432	58	.408	.410	.413	.416	.419
44	.420	.423	.425	.428	.431	59	.407	.409	.412	.415	.418
45	.419	.422	.425	.427	.430	60	.406	.409	.411	.414	.417
46	.418	.421	.424	.427	.429	61	.405	.408	.411	.413	.416
47	.417	.420	.423	.426	.429	62	.404	.407	.410	.413	.415
48	.416	.419	.422	.425	.428	63	.403	.406	.409	.412	.414
49	.415	.418	.421	.424	.427	64	.402	.405	.408	.411	.414
50	.415	.417	.420	.423	.426	65	.402	.404	.407	.410	.413
51	.414	.416	.419	.422	.425	66	.401	.404	.406	.409	.412
52	.413	.415	.418	.421	.424	67	.400	.403	.405	.408	.411
53	.412	.415	.417	.420	.423	68	.399	.402	.405	.407	.410
54	.411	.414	.417	.419	.422	69	.398	.401	.404	.407	.409

Such a table should, of course, be extended to such limits of temperature and pressure as will comprehend the highest and lowest readings recorded at the station; and it may be further elaborated by interpolating the values for the alternate tenths of an inch, &c., according to convenience.

It is to be observed, in the use of all such tables, that the external temperature refers, strictly speaking, to the mean temperature of the column of air below the station down to sea-level. This may be obtained by adding 0·1 for every 90 feet of elevation to the air temperature observed at the station. But the correction thus introduced is scarcely appreciable in the result.

The table cannot be used for elevations greater than 500 feet. At higher stations it is better to use the table based on Laplace's barometric formula, which has been computed by Captain Allen Cunningham, R.E., published in the Roorkee Professional Papers on Indian Engineering, second series, No. CXIII.

---

TABLE III.—This table gives the tension of saturated aqueous vapour, in decimals of an inch of mercury at the temperature 32°, in latitude 22°, at the level of the sea. It has been reduced from the original table for the latitude of Dublin, computed by the Rev. Robert Dixon; by correcting his values for the difference of gravity, *viz.*, multiplying them by the constant factor 1·00286184.

The psychrometric tables which follow are all based on this table, and the computation has been chiefly made by the aid of the arithmometer.

The chief use of this table is in computing the humidity and vapour tension, from observations of the dry and wet bulb thermometers, by August's or Apjohn's formula; and for finding the dew point corresponding to that vapour tension.

August's formula, which has been used in computing the Tables IV to XI, is as follows :—

For temperatures of the *wet* bulb below 32°,

$$x = f' - \frac{480(t-t')}{12402-t'} h$$

and for temperatures of *wet* bulb above 32°

$$x = f' - \frac{480(t-t')}{1130-t'} h$$

wherein  $t$  and  $t'$  are the temperatures of the dry and wet bulb thermometers respectively, in Fahr. degrees,  $f'$  the tension of vapour at temperature  $t'$ ,  $h$  the reading of the barometer in inches, and  $x$  the tension of the vapour present in the air at the time of the observation.

The value of  $f'$  corresponding to  $t'$  is given by Table III, taking  $t'$  as the argument; and when  $x$  has been computed, the temperature which, in Table III, corresponds to  $x$ , is that of the dew point.

EXAMPLE.—Required the vapour tension and dew point of the atmosphere when the readings of the dry and wet bulb thermometers are 98°·1 and 63°·4, and the barometer reading (reduced to 32°) 29·763.

Here  $t = 98\cdot1$ ,  $t' = 63\cdot4$ , and  $(t-t') = 34\cdot7$ ,  $h = 29\cdot763$  and, from the table,  $f' = .5953$

$$x = .5953 - \frac{480 \times 34\cdot7}{1130-63\cdot4} 29\cdot763 = .1305$$

which is the vapour tension required.

The temperature in the table, corresponding to .1305, is 24·4. This, therefore, is the computed dew point of the air at the time of the observation.

---

Tables IV, VI, VIII and X are given to save the trouble of calculation, and show at once the vapour tension corresponding to any given readings of the dry and wet bulb thermometers, when the pressures are respectively 29·7, 27·7, 25·8 and 23·4, these being the average pressures at stations (IV) at and near the sea-level, (VI) at 2,000 feet, (VIII) at 4,000 feet and (X) at 7,000 feet respectively. For all ordinary

purposes the vapour tensions thus computed to a constant mean barometric pressure are sufficiently exact.

The use of the tables is very simple. Having corrected the readings of the dry and wet bulb thermometers for their errors of graduation, deduct that of the wet bulb  $t'$  from that of the dry bulb  $t$ . Then, in the left-hand column of the table, look out the temperature of the wet bulb, and in that line and in the column the heading of which is the difference  $t-t'$  will be found the vapour tension required.

**EXAMPLE.**—At Házáribagh 2,010 feet above sea-level, the corrected temperature of the dry bulb is 103·2 and that of the wet bulb 70·5. Required the vapour tension.

$$\begin{aligned} \text{Here } t-t' &= 32\cdot7 \\ t' &= 70\cdot5 \end{aligned}$$

and the station being 2,010 feet above sea-level, we use Table VI.

By the table in line 70° and column 32·5, vapour tension = .327
Ditto      70°      ditto      33·      ditto      = .321
Ditto      71°      ditto      32·5,      ditto      = .351
Ditto      71°      ditto      33·      ditto      = .346

from which four values, by interpolating for the tenths of degrees in the manner already shown for the barometric Table I, we obtain .335, which is the vapour tension required.

These tables, together with Table III, may be used to find the dew point of the air from observations of the dry and wet bulb thermometers. Having found the tension of vapour in the air by the help of the former, turn to Table III, and the temperature corresponding to that tension is the dew point required.

Tables IV, VII, IX and XI are used in the same way as the foregoing, and give the relative humidity of the air corresponding to any observed temperatures of the dry and wet bulb thermometers for the same four values of mean pressure.

By the 'relative humidity' of the air is understood the proportion which the weight of water vapour present in the air bears to that which would saturate it at the temperature of the dry bulb. This, by Boyle's law, is directly as the proportion which the actual vapour tension bears to that of saturation, and the ratio is expressed as a percentage of the latter. Thus, in the example above given, .335 is the actual vapour tension, and, by extending Table III up to the temperature of 103·2, we find that the vapour tension of saturation at that temperature is 2·1156. Hence the relative humidity

$$\frac{.335 \times 100}{2.1156} = 16 \text{ nearly}$$

which is the number given in Table VII for wet bulb temperature 70·5, and a difference of 32·7.

Table XII shows the weight of vapour (in Troy grains) in a cubic foot of air at different temperatures, when the vapour tension is given, the vapour tensions being expressed in terms of the gravitation of a column of mercury in latitude 22°. In computing this table, I have assumed the weight of a cubic foot of dry air at 30 inches pressure (in the latitude of Dublin), and at 32° Fahrenheit, to be 563 grains; and that water vapour weighs  $\frac{9}{14.45}$  as much as dry air at the same pressure and temperature. Also, I have taken the expansion of water vapour at the same value as that of air, *viz.*,  $\frac{1}{453}$  of the volume at 32° for each degree Fahrenheit. Hence at any temperature  $t$  the weight  $x$  of one cubic foot of vapour at pressure  $p$  is

$$x = \frac{563 \times 493}{461 + t} \times \frac{9}{14.45} \times \frac{p}{30 \times 1.00286}$$

$$= 5746.037 \frac{p}{461 + t}$$

The values have been computed for even thousandths, hundredths and tenths of an inch, and for one and two inches of pressure; and for the temperature of the

freezing point and successive decrements and increments of 5 degrees between  $2^{\circ}$  and  $127^{\circ}$ ; by the addition of which, the weights corresponding to all pressures up to 3 inches may be easily calculated.

EXAMPLE.—The tension of vapour in the air is found to be .679, and the temperature  $93^{\circ}$ . What is the weight of vapour in the cubic foot?

For '6 take 6.23 and 6.18, which are the values for that pressure in the columns for  $92^{\circ}$  and  $97^{\circ}$ ; for '07 the tensions 0.73 and 0.72 from the same columns; and for '09 the value 0.09 from the same columns. Then, adding separately for the two temperatures—

$$\begin{array}{r} 6.23 \\ .73 \\ .09 \\ \hline 7.05 \end{array} \qquad \begin{array}{r} 6.18 \\ .72 \\ .09 \\ \hline 6.99 \end{array}$$

the sums 7.05 and 6.99 represent the weights corresponding to  $92^{\circ}$  and  $97^{\circ}$ . The difference is 0.06. One-fifth of this deducted from 7.06, or four-fifths added to 6.99, gives 7.04 grains for the temperature  $93^{\circ}$ ; which is the answer required.

TABLE I.

## **For reducing Observations of the Barometer to the Temperature of 32° Fahrenheit.**

*This Table is applicable only to Barometers with Brass Scales.*

TABLE I,  
For reducing Observations of the Barometer to the Temperature of 32°  
Fahrenheit—(continued).

Tempera-ture, Fahrenheit.	REDUCTION OF THE BAROMETER TO 32° FAHRENHEIT.												Tempera-ture, Fahrenheit.	
	HEIGHT OF THE BAROMETER IN INCHES, AND CORRECTION IN DECIMALS OF AN INCH.

This table has been extended so as to include ranges of temperature from −10° to 0°, and from 100° to 110° Fahrenheit and for inches below 20, by means of the formula ( $b$  being the reading of the barometer and  $t$  the temperature) :—

$$\text{Reduction} = \frac{b}{1+0'0001001(t-32)-0'00001049(t-62)}$$

which is the formula used by Schumacher in the construction of the original table. See *Sammlung von Hulfsstafeln*, p. 187, New Ed. Altona, 1845.

**TABLE II,**  
For reducing Observations of the Barometer to sea-level, correction additive.

TABLE VI,

For finding the Tension of Vapour in the Air, in English inches, from the readings of the dry  $t$  and wet bulb  $t'$  thermometers, at the mean barometric pressure of 27·7 inches and in the latitude of 22°—(continued).

Wet bulb $t'$ .	VALUES OF $t-t'$ IN DEGREES, FAHRENHEIT.

TABLE XII,

For finding the Weight of Water Vapour, in Troy grains, in each cubic foot of air at each temperature, and for any given vapour tension  $p$ , as expressed in inches of mercury, in latitude  $22^{\circ}$ —(continued).

$p.$	TEMPERATURE OF AIR.												
	$67^{\circ}$ .	$72^{\circ}$ .	$77^{\circ}$ .	$82^{\circ}$ .	$87^{\circ}$ .	$92^{\circ}$ .	$97^{\circ}$ .	$102^{\circ}$ .	$107^{\circ}$ .	$112^{\circ}$ .	$117^{\circ}$ .	$122^{\circ}$ .	$127^{\circ}$ .
